

Trabajo Práctico 6 - Construcción de Imágenes de Docker

1- Conceptos de Dockerfiles

FROM: La instrucción FROM es el punto de partida para una imagen de Docker. La elección de una imagen base adecuada es crucial para garantizar que tengamos el entorno necesario para nuestras aplicaciones. Dependiendo de nuestros requisitos, podemos optar por imágenes de sistemas operativos base o imágenes con software específico preinstalado.

RUN: Con la instrucción RUN, podemos realizar tareas de configuración y preparación en nuestra imagen. Esto es fundamental para instalar software adicional, configurar variables de entorno o realizar cualquier acción necesaria durante la construcción de la imagen.

ADD y COPY: Estas instrucciones nos permiten copiar archivos y directorios locales en nuestra imagen. ADD también puede manejar la extracción de archivos desde URL. Elegir entre ADD y COPY depende de nuestras necesidades, y estas instrucciones son esenciales para incluir recursos en la imagen.

EXPOSE: Al usar la instrucción EXPOSE, podemos especificar en qué puertos esperamos que escuche nuestro contenedor. Aunque esta instrucción no publica automáticamente los puertos, es fundamental para documentar y comunicar los puertos utilizados por nuestra aplicación.

CMD y ENTRYPOINT: Estas instrucciones definen comandos o aplicaciones predeterminadas para ejecutar cuando se inicia un contenedor. CMD es más flexible y se puede anular fácilmente al ejecutar el contenedor con un comando diferente. En cambio, ENTRYPOINT se utiliza cuando deseamos definir un punto de entrada fijo que no se anulará tan fácilmente.

2- Generar imagen de docker

```

tincho@IdeaPad-5-14ALC05:~/Documents/Ingenieria de Software III/TP5/MiProyectoWebAPI$ docker build -t miprojectowebapi .

What's Next?
View a summary of image vulnerabilities and recommendations → docker scout quickview

```

La primera etapa, llamada base, es similar a la etapa anterior. Utiliza la imagen `mcr.microsoft.com/dotnet/aspnet:7.0` como base, establece el directorio de trabajo en `/app` y expone el puerto 80.

La segunda etapa, llamada build, también es similar a la etapa anterior. Utiliza la imagen `mcr.microsoft.com/dotnet/sdk:7.0` como base y se encarga de la compilación del proyecto. Establece el directorio de trabajo en `/src`, copia el archivo de proyecto `MiProyectoWebAPI.csproj`, restaura las dependencias con `dotnet restore`, copia todos los archivos del proyecto y luego compila el proyecto en la carpeta `/app/build`.

La tercera etapa, llamada publish, se basa en la etapa build y se encarga de la publicación del proyecto. Utiliza dotnet publish para generar los archivos de salida en la carpeta /app/publish. Se establece la opción /p:UseAppHost=false para indicar que no se debe usar el host de la aplicación.

La cuarta etapa, llamada final, es similar a la etapa anterior y se basa en la etapa base. Configura el directorio de trabajo en /app, copia los archivos generados en la etapa de publish en la carpeta /app y configura el punto de entrada para la aplicación utilizando ENTRYPOINT.

```
root@20c77a72293d:/# ls
app  boot  etc   lib   media  opt   root  sbin  sys  usr
bin  dev   home  lib64 mnt    proc  run   srv   tmp  var
root@20c77a72293d:/# cd app/
root@20c77a72293d:/app# ls
MiProyectoWebAPI.deps.json      Microsoft.OpenApi.dll          appsettings.Development.json
MiProyectoWebAPI.dll            Newtonsoft.Json.dll            appsettings.json
MiProyectoWebAPI.pdb            Swashbuckle.AspNetCore.Swagger.dll  web.config

4- Imagen para aplicación web en Nodejs

```
tincho@IdeaPad-5-14ALC05:~/Documents/Ingenieria de Software III/TP6/trabajo-practico-06/nodejs-docker$ npx create-react-app my-app

Creating a new React app in /home/tincho/Documents/Ingenieria de Software III/TP6/trabajo-practico-06/nodejs-docker/my-app.

Installing packages. This might take a couple of minutes.
Installing react, react-dom, and react-scripts...

added 1000 packages in 54s

39 packages are looking for funding
  run `npm fund` for details

Success! Created my-app at /home/tincho/Documents/Ingenieria de Software III/TP6/trabajo-practico-06/nodejs-docker/my-app
Inside that directory, you can run several commands:

  npm start
    Starts the development server.

  npm run build
    Bundles the app into static files for production.

  npm test
    Starts the test runner.

  npm run eject
    Removes this tool and copies build dependencies, configuration files
    and scripts into the app directory. If you do this, you can't go back!

We suggest that you begin by typing:

  cd my-app
  npm start

Happy hacking!

Note: the project was bootstrapped with an old unsupported version of tools.
Please update to Node >=14 and npm >=6 to get supported tools in new projects.
```

```
